CONDA,00026 Patent

IN THE CLAIMS:

The following a complete listing of the claims currently pending in the application:

(Currently amended) A clamping apparatus for use in clamping a member, the clamping
apparatus comprising a support member for supporting the member to be clamped at a
predetermined position, a mounting member attached to the support member, a clamp
arm attached to the mounting member to be able to reciprocate with respect to the
mounting member, a pressure applying mechanism, which is located between the
mounting member and the clamp arm and applies pressure to the clamp arm, and a clamp
bolt, which is located on the clamp arm and clamps the member to be clamped between
the clamp bolt and the support member,

wherein a threaded cylinder having an external thread portion and an internal thread portion is attached to the clamp arm, wherein the height of the threaded cylinder is adjustable by utilizing the external thread portion and wherein the clamp bolt is serewed into the internal thread portion of the threaded cylinder;

wherein a groove is formed in the elamp arm, the <u>threaded cylinder containing the</u> clamp bolt is attached to the guide groove such that the position of the <u>threaded cylinder</u> elamp-bolt is adjustable.

wherein when the elamp-bolt threaded cylinder is inserted in the guide groove, a first lock nut and a second lock nut are screwed to the elamp-bolt external thread portion of the threaded cylinder to sandwich the elamp arm from above and below, and the elamp bolt threaded cylinder is secured at a predetermined position of the elamp arm by securely tightening the first lock nut and the second lock nut to the clamp arm,

wherein an upper washer is located between the clamp arm and the first lock nut and a lower washer is located between the clamp arm and the second lock nut, the upper washer and the lower washer each have a rotation restricting rib, the rotation restricting ribs are engaged with the upper and lower rims of the clamp arm for restricting rotation of the upper washer and the lower washer,

wherein the second lock nut is fixed to the lower surface of the lower washer, and wherein a manipulation portion is provided on the clamp bolt above the clamp arm, the manipulation portion being used for rotating the clamp bolt within the threaded

- 6. (Cancelled)
- (Previously presented) The clamping apparatus according to claim 1, wherein an
 engaging hole is formed at an upper end of the clamp bolt, the engaging hole being
 engageable with the distal end of a wrench for rotational manipulation.
- (Cancelled)
- (Previously presented) The clamping apparatus according to claim 1, wherein the pressure
 applying mechanism is a toggle mechanism.
- 10. (Previously presented) The clamping apparatus according to claim 1, wherein a pad is located at the distal end of the clamp bolt, the pad abuts against an upper surface of the member to be clamped and permits the clamp bolt to rotate relative to the pad.
